

To do HTML Report Setup in Cypress Cucumber framework, please follow the steps given below:

- Install cypress cucumber preprocessor in the system using command:
 - `npm install --save-dev cypress-cucumber-preprocessor`
- Package.json file will be created
- You can now add the dependencies and script in package.json file
- To enable cucumber usage need to make some configuration in three files
 - Index.js (inside plugins folder)
 - Cypress.json
 - Package.json

- Add the required configuration in above mentioned file
- In index.js add
 - `module.exports = (on, config) => {`
 - `// `on` is used to hook into various events Cypress emits`
 - `// `config` is the resolved Cypress config`
 - `}`
 - `const cucumber =`
 - `require('cypress-cucumber-preprocessor').default`
 - `module.exports = (on, config) => {`
 - `on('file:preprocessor', cucumber())`
 - `}`
- In cypress.json add
 - `{`
 - `"testFiles": "**/*.feature, features"`

- }
- In package.json add
 - `"cypress-cucumber-preprocessor": {`
 - `"nonGlobalStepDefinitions": true`
 - `}`
